

Morfin **XF**

CROSSFADER

USER MANUAL

Manual Version 1.0.3
Morfin XF Version 1.0.1

Wikipedia: “Crossfader essentially works like two faders connected side by side but opposite directions”

Groovy Melon Morfin XF completely fulfills the Wikipedia definition of crossfader, and best of all it does its job on your Reason Rack. However, Morfin XF is armed with groovy features other than that, improving the versatility of the device while keeping it simple to use.

In a nutshell, Morfin XF is a crossfader with 4 inputs where any two of these inputs can be selected to be crossfaded between. The transition behavior (i.e. taper or transition curve) between these inputs can be controlled by means of a selector knob on Morfin XF. The types support wide varieties of usages, such as

traditional equal power crossfading or removing and pumping it up. It has a CV input for the crossfader control and two CV outputs for both deck A and B. With the help of these CV in and outs, Morfin XF can be used as a simple CV shaper.

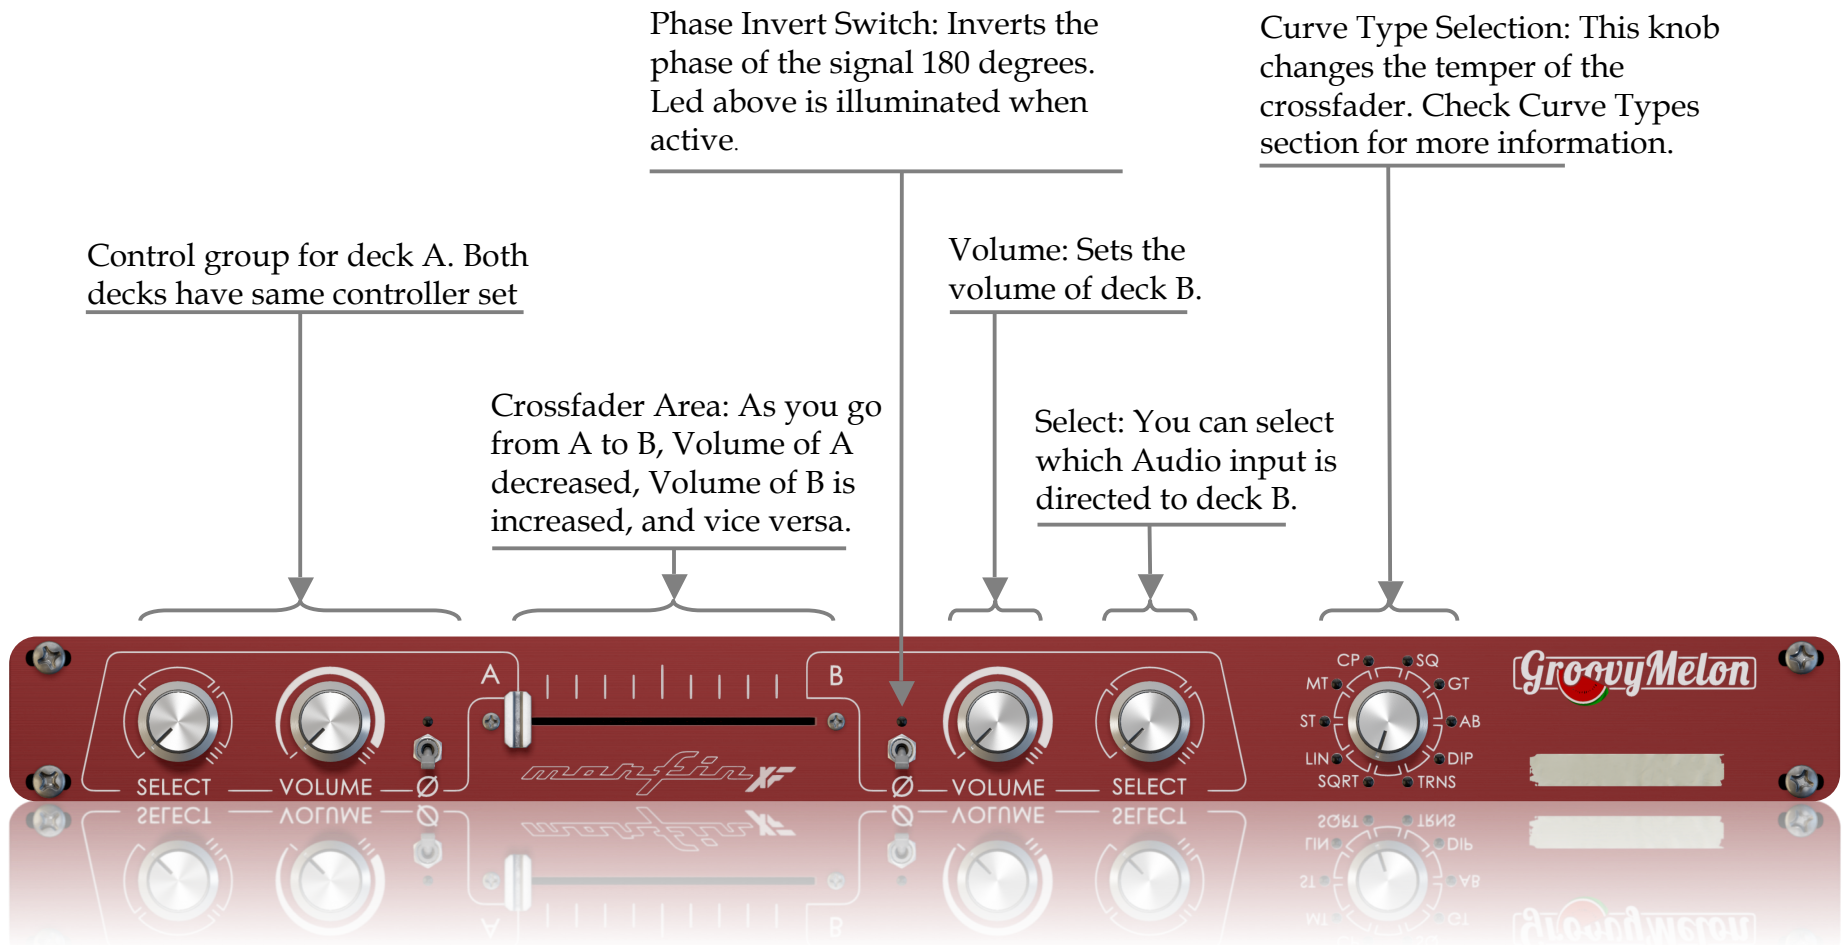

In this document, you can find valuable information on curve and power graphics of the tapers, operation modes, auto - routing tips and more about Morfin XF.

We hope you like Morfin XF

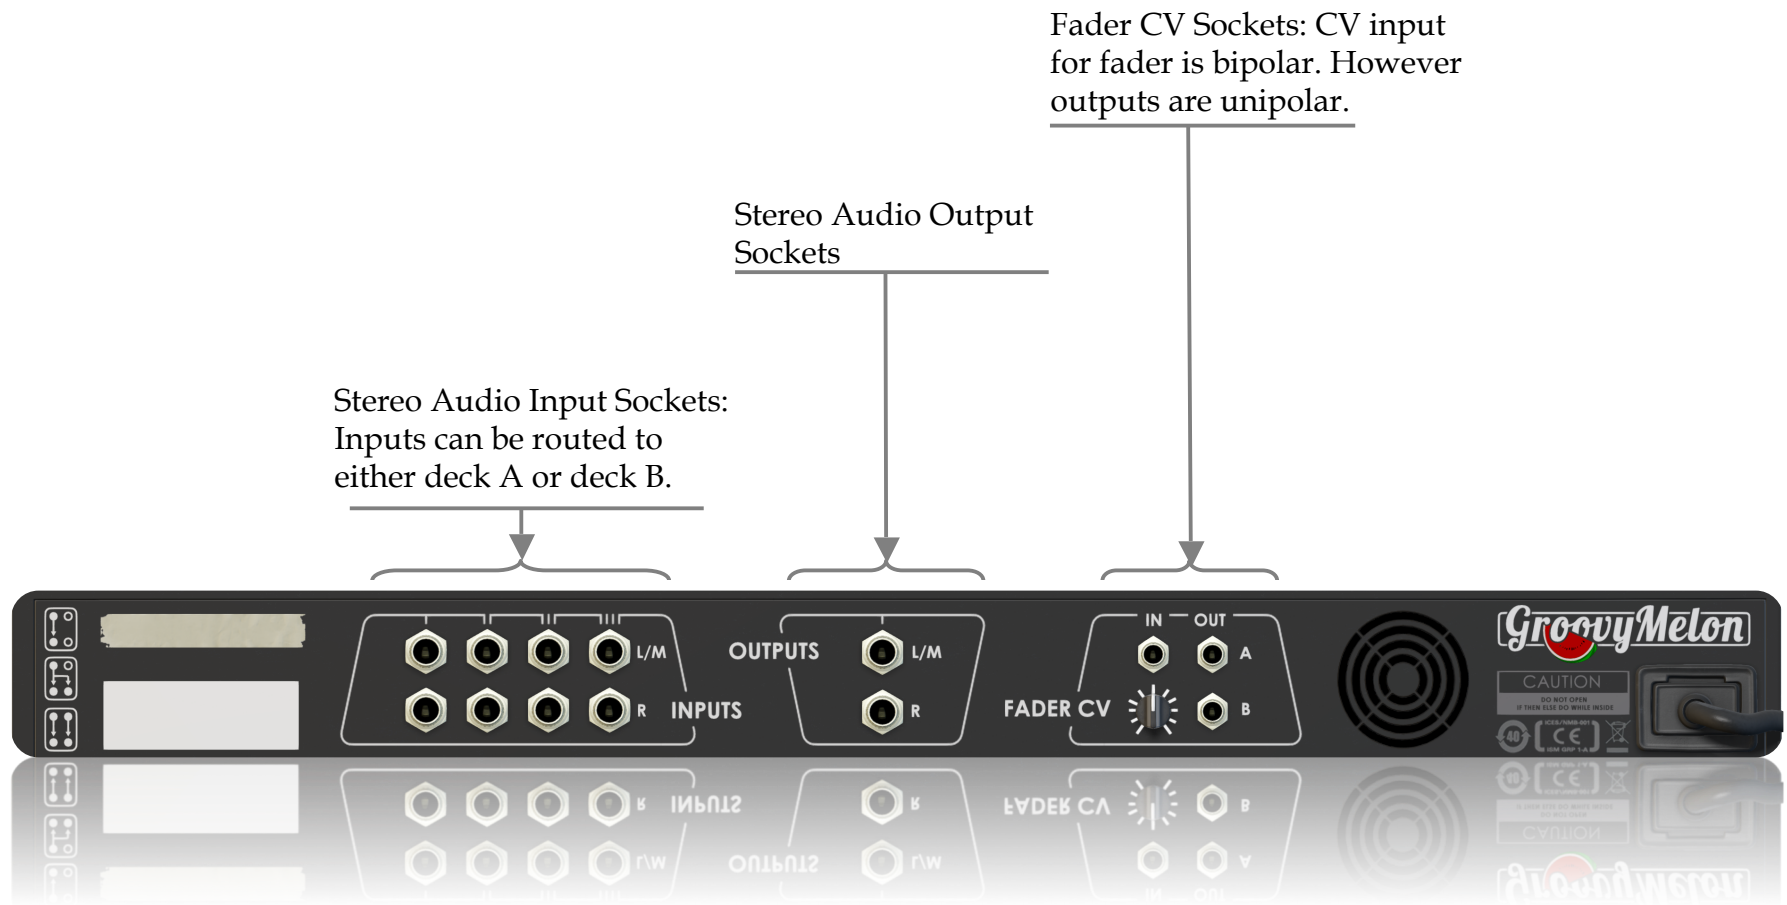

Morfin XF is armed with extra groovy features that improve the versatility of the device while keeping its usage simple.

Front panel quick overview

Back panel quick overview

Operation modes

When you connect **ONLY** left inputs and outputs, Morfin XF is in mono mode.

When you connect **ONLY** the left inputs of Morfin XF but **BOTH** left and right outputs are connected to the next device in the chain, Morfin XF duplicates its inputs to the right output channel also.

When one of the left and right inputs connected, Morfin XF is in stereo mode. The other inputs connected only to left will be duplicated also to the right channel.

Auto – routing tips

When standard crossfader operation needed, you can connect devices to Morfin XF without turning your rack with this simple rules.

Let's begin with a SOUND MODULE (Dr. OctoRex, NN-XT, etc). When you throw a Morfin XF just beneath a sound module, you will see that main outputs of sound module are connected to Morfin XF input 1 and Morfin XF outputs are connected to Audio track inputs.

From this point on, as we create more sound modules under Morfin XF, their outputs will be automatically routed to the next available inputs of Morfin XF.

If you throw an EFFECT DEVICE under Morfin XF, effect device outputs will be routed to the next

available input. But the effect input will be left unconnected.

If you create a Morfin XF under an effect device, Morfin XF audio output will be routed to the effect device inputs.

CV INPUTS & OUTPUTS are never auto – routed. You have to connect them manually by turning the rack around.

Power and Amplitude Curves

power curve

amplitude curve

SQRT
Square Root

LIN
Linear

ST
Sharp Taper
a.k.a Fast Cut

The best way to “hear” an AMPLITUDE curve is keeping one of the decks (A or B) silent and moving the crossfader of Morfin XF.

Power and Amplitude Curves

power curve

amplitude curve

MT
Medium
Taper

CP
Constant
Power

SQ
Squared

If you want to be FAST AND ACCURATE at the same time, use CV input of Morfin XF.

Power and Amplitude Curves

amplitude curve

GT
Gentle Taper
a.k.a
Slow Cut

AB
A-B switch

CV input of Morfin XF is BIPOLAR. But CV output of Morfin XF is UNIPOLAR. CV output B is the inverted copy of CV output A.

The best way to hear a POWER curve is feeding deck B with the 90 degrees phase shifted version of the audio source on deck A and moving the crossfader of Morfin XF. And the easiest way is:
